Complete Summary

TITLE

Competency Assessment Instrument (CAI): provider's mean score on the "Client Preferences" scale.

Brief Abstract

DESCRIPTION

The Competency Assessment Instrument (CAI) measures 15 competencies needed to provide high quality care for those with severe and persistent mental illness (SPMI). This measure assesses the "Client Preferences" scale on the CAI; defined as "Learns and respects their clients' preferences regarding their treatment."

This measure is a component of a disaggregatable composite measure. The "Client Preferences" scale is one of 15 individual CAI scales. A summary total score (summary index) of all 15 scales is calculated.

RATIONALE

The quality of care for serious mental illness is frequently poor. Most practicing mental health clinicians lack sufficient specialized training, and are not well prepared to provide rehabilitation services. In the United States, over three-quarters of clinicians have a bachelor's degree or less education. Even among the small proportion of doctoral-level professionals, many have not been exposed to curricula or practicum experiences that are relevant to the care of people with severe and persistent mental illness (SPMI). Thus, existing care is often not patient-centered because many clinicians lack important clinical competencies in the areas of empowerment and recovery that are at the heart of rehabilitation. Recent reviews find that this lack of competencies is a critical barrier to provide high quality care. Therefore, competency assessment has the potential to inform broad quality improvement efforts that affect clinician recruitment, training, feedback and profiling.

There is a critical need for measures of important domains of treatment process for SPMI. Competencies are a useful domain to assess because they emphasize the skills and values that may be less visible in a guideline or standards-based approach, but are equally important to care. Thus, the Competency Assessment Instrument (CAI) is well suited to be a quality improvement tool enabling researchers, providers, and administrators to reliably and validly assess which competencies need the most attention, which improves with training, and which need further development.

A strength of the competencies included in the CAI are that they were specifically chosen to represent rehabilitation, recovery, and empowerment principles, which are aspects of care that are critical to the treatment of patients with SPMI but are often lacking in public settings. Underlying recovery-oriented care is the idea that persons can regain purpose and meaning in life while having a serious mental illness. These concepts, which tend not to be included in many treatment guidelines and standards, have proved to be important aspects of high quality care for those with SPMI.

PRIMARY CLINICAL COMPONENT

Provider competency; serious mental illness, schizophrenia, bipolar disorder; major depression

DENOMINATOR DESCRIPTION

This measure applies to providers of services to those with serious mental illness (one provider at a time).

NUMERATOR DESCRIPTION

Mean scale score on "Client Preferences" scale of the Competency Assessment Instrument (CAI)

Evidence Supporting the Measure

PRIMARY MEASURE DOMAIN

Structure

SECONDARY MEASURE DOMAIN

Not applicable

EVIDENCE SUPPORTING THE MEASURE

A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

Evidence Supporting Need for the Measure

NEED FOR THE MEASURE

Overall insufficient capacity

BURDEN OF ILLNESS

Treatment quality for those with severe and persistent mental illness (SPMI), including schizophrenia, bipolar disorder, and major depression is often poor, which can lead to serious negative outcomes such as injury or death.

EXTENT OF MEASURE TESTING

The "Client Preferences" scale of the Competency Assessment Instrument (CAI) was tested for internal consistency (Cronbach's alpha equal to 0.60) and test-retest reliability (intraclass correlation equal to 0.69). Results also support the concurrent and construct validity of the CAI.
